Matrix Theory (EE5609) Assignment 12

Arkadipta De MTech Artificial Intelligence AI20MTECH14002

Abstract—This document proves that, each field of the characteristic zero contains a copy of the rational number field.

All the codes for the figure in this document can be found at

1 Problem

Consider the system of equations AX = 0 where

$$\mathbf{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

is a 2×2 matrix over the field F. Prove the following

- If every entry of **A** is 0, then every pair x_1 and x_2 is a solution of $\mathbf{AX} = 0$.
- If $ad bc \neq 0$, then the system AX = 0 has only the trivial solution $x_1 = x_2 = 0$
- If ad bc = 0 and some entry of **A** is different from 0, then there is a solution x_1^0 and x_2^0 such that x_1 and x_2 is a solution if and only if there is a scalar y such that $x_1 = yx_1^0$ and $x_2 = yx_2^0$

2 Solution

2.1 Solution 1

If every entry of A is 0 then the equation AX = 0 becomes,

$$\begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = 0 \tag{2.1.1}$$

$$\implies 0.x_1 + 0.x_2 = 0 \qquad \forall x_1, x_2 \in F \qquad (2.1.2)$$

Hence proved, every pair x_1 and x_2 is a solution for the equation AX = 0.

2.2 Solution 2

Case 1: Let a = 0. Since $ad - bc \neq 0$. As $bc \neq 0$ therefore $b \neq 0$ and $c \neq 0$. Hence, we can perform row reduction on the augmented matrix of equation AX=0 as follows.

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 0 & b & 0 \\ c & d & 0 \end{pmatrix} = \begin{pmatrix} \frac{1}{c} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} c & d & 0 \\ 0 & b & 0 \end{pmatrix}$$
 (2.2.1)

$$= \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{b} \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & b & 0 \end{pmatrix} \tag{2.2.2}$$

1

$$= \begin{pmatrix} 1 & -\frac{d}{c} \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & 1 & 0 \end{pmatrix} \quad (2.2.3)$$

$$= \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix} \tag{2.2.4}$$

Case 2: Let $a, b, c, d \neq 0$. Considering the following case,

$$\mathbf{AX} = \mathbf{u} \tag{2.2.5}$$

$$\implies \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} u_1 \\ u_2 \end{pmatrix} \tag{2.2.6}$$

Row Reducing the augmented matrix of (2.2.6) we get,

$$\begin{pmatrix} \frac{1}{a} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} a & b & u_1 \\ c & d & u_2 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ -c & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{a} \\ c & d & u_2 \end{pmatrix}$$
 (2.2.7)
$$= \begin{pmatrix} 1 & 0 \\ 0 & \frac{a}{ad-bc} \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{a} \\ 0 & \frac{ad^2-bc}{a} & \frac{au_2-cu_1}{a} \end{pmatrix}$$
 (2.2.8)
$$= \begin{pmatrix} 1 & -\frac{b}{a} \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & \frac{u_1}{ad-bc} \\ 0 & 1 & \frac{au_2-cu_1}{ad-bc} \end{pmatrix}$$
 (2.2.9)

$$= \begin{pmatrix} 1 & 0 & \frac{du_1 - bu_2}{ad - bc} \\ 0 & 1 & \frac{au_2 - cu_1}{ad - bc} \end{pmatrix}$$
 (2.2.10)

From (2.2.10) we get,

$$x_1 = \frac{du_1 - bu_2}{ad - bc} \tag{2.2.11}$$

$$x_2 = \frac{au_2 - cu_1}{ad - bc}$$
 (2.2.12)

Since $u_1 = 0$ and $u_2 = 0$ then from (2.2.11) and (2.2.12),

$$x_1 = 0 (2.2.13)$$

$$x_2 = 0 (2.2.14)$$

Hence we get,

$$\mathbf{x} = \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \tag{2.2.15}$$

In (2.2.4) and (2.2.15), we can see that $\mathbf{AX} = 0$ has only one trivial solution i.e $x_1 = x_2 = 0$ in all cases. Hence proved, the equation $\mathbf{AX} = 0$ has only one trivial solution $x_1 = x_2 = 0$

2.3 Solution 3

Case 1: Let, $a \neq 0$ for **A**. Given ad - bc = 0, we can perform row reduction on augmented matrix of equation AX = 0 as follows,

$$\begin{pmatrix} \frac{1}{a} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ -c & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{b}{a} & 0 \\ c & d & 0 \end{pmatrix} \qquad (2.3.1)$$
$$= \begin{pmatrix} 1 & \frac{b}{a} & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad [\because ad - bc = 0]$$
$$(2.3.2)$$

Hence from (2.3.2), AX = 0 if and only if

$$x_1 = -\frac{b}{a}x_2 \qquad [a \neq 0] \tag{2.3.3}$$

Letting $x_1^0 = -\frac{b}{a}$ and $x_2^0 = 1$ we get for y = 1,

$$x_1 = yx_1^0 (2.3.4)$$

$$x_2 = yx_2^0 (2.3.5)$$

which is a solution of the equation AX = 0.

Case 2: Let, $b \neq 0$ for **A**. Given ad - bc = 0, at first we multiply by elementary matrix to change the columns and the we can perform row reduction on augmented matrix of equation AX = 0 as follows,

Hence using the result obtained from (2.3.2) we can conclude for (2.3.6), $\mathbf{AX} = 0$ if and only if

$$x_2 = -\frac{a}{b}x_1 \qquad [b \neq 0] \tag{2.3.7}$$

Letting $x_2^0 = -\frac{a}{b}$ and $x_1^0 = 1$ we get for y = 1,

$$x_1 = yx_1^0 (2.3.8)$$

$$x_2 = yx_2^0 (2.3.9)$$

which is a solution of the equation AX = 0.

Case 3: Let, $c \neq 0$ for **A**. Given ad - bc = 0, we can perform row reduction on augmented matrix of equation AX = 0 as follows,

$$\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} = \begin{pmatrix} \frac{1}{c} & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} c & d & 0 \\ a & b & 0 \end{pmatrix}$$
 (2.3.10)
$$= \begin{pmatrix} 1 & 0 \\ -a & 1 \end{pmatrix} \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ a & b & 0 \end{pmatrix}$$
 (2.3.11)
$$= \begin{pmatrix} 1 & \frac{d}{c} & 0 \\ 0 & 0 & 0 \end{pmatrix}$$
 [:: $ad - bc = 0$]
(2.3.12)

Hence from (2.3.12), AX = 0 if and only if

$$x_1 = -\frac{d}{c}x_2 \qquad [a \neq 0] \tag{2.3.13}$$

Letting $x_1^0 = -\frac{d}{c}$ and $x_2^0 = 1$ we get for y = 1,

$$x_1 = yx_1^0 (2.3.14)$$

$$x_2 = yx_2^0 (2.3.15)$$

which is a solution of the equation AX = 0.

Case 4: Let, $d \neq 0$ for **A**. Given ad - bc = 0, at first we multiply by elementary matrix to change the columns and then we can perform row reduction on augmented matrix of equation $\mathbf{AX} = 0$ as follows,

$$\begin{pmatrix} a & b & 0 \\ c & d & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} b & a & 0 \\ d & c & 0 \end{pmatrix}$$
 (2.3.16)
$$= \begin{pmatrix} d & c & 0 \\ b & a & 0 \end{pmatrix}$$
 (2.3.17)

Hence using the result from (2.3.12) we can conclude for (2.3.17), $\mathbf{AX} = 0$ if and only if

$$x_2 = -\frac{c}{d}x_1 \qquad [a \neq 0] \tag{2.3.18}$$

Letting $x_2^0 = -\frac{c}{d}$ and $x_1^0 = 1$ we get for y = 1,

$$x_1 = yx_1^0$$
 (2.3.19)
 $x_2 = yx_2^0$ (2.3.20)

$$x_2 = yx_2^0 (2.3.20)$$

which is a solution of the equation AX = 0. Hence Proved.
